CSCE 689: Advanced Graph Algorithms

Lecture 6: Vertex Cover, Matching, and LP duality

Date: Sept 13, 2022 Lecturer: Nate Veldt

Course logistics

- HW 1 due end of today.
- Solution key will be posted by midnight. You are allowed to submit 1 day late with a 15% late penalty.

Recap: Last week

- LP duality
- Totally unimodular matrices in linear programming

This week: Vertex Cover, Matchings, and More LP duality

max
$$b^{T}y$$
 (2)
 $y \in Q^{m}$ $A^{T}y \leq C$ (dual)

Theorem (weak duality): Let & be feasible for (2), then for (1) and y is feasible for (2), then

Proof: CTZ > yTAZ > yTb

Theorem (strong duality): Let (x^*, y^*) be optimal for LP(1) and LP(2) respectively, then $c^{T}x^* = b^{T}y^*$

lassuming both UPs are feasible)

Find the dual

Strategy 1: learn a set of rules and apply them

(1 variable for each constraint,
1 constraint for each variable)

Strategy 2: convert the LP into standard or canonical form and standard or canonical form and apply one of the following patterns

	Primal	Duals
canonical	min C ^T X Ax?b x?0	max $6^{5}y$ $A^{7}y \leq c$ $y > 0$
standard	min $c^T \times A_{\times} = b$ $\times > 0$	max $b^{T}y$ $A^{T}y \leq C$

Common examples in graph analysis

- · The dual of the max s-t flow LP is the min s-t cut LP
- In bipartite graphs the dual of the max matching problem is the min vertex cover problem.

TU Matrices in Linear Programming

For the UP V

min cTX

Axzb

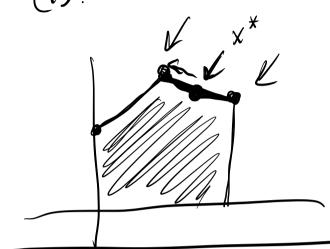

xz0

zell

The state of the stat

Theorem TU: If $b \in \mathbb{Z}^m$ and A is totally unimodular (all square submatrices have determinant 0, 1, or -1) then

there exists $x^* \in \mathbb{Z}^n$ that is optimal for (1).

Vertex Cover and Matchings

Def: a matching $M \subseteq E$ of a simple graph G = (V, E) is a vertex disjoint set of edges.

Def: a vertex cover $C \subseteq V$ of $G = (V_i E)$ is a set of nodes such that every ext is adjacent to at least one node in C.

i.e. len C/20 # e&E.

Lemma: Let G = (V,E) be a simple graph, C a vertex cover, and M be a matching then [M] = [C]

LP duality for Vertex Cover

The minimum vertex cover problem
(Min-VC) is encoded by the binary
linear program (BLP)

 $\min \sum_{v \in V} x_v$ (1)

s.t. $x_{n} + x_{v} > 1 \quad \forall \quad (u,v) \in E$ $x_{n} \in \{0,1\} \quad \forall \quad u \in V$

Min-VC is NP-hard.

Let BLP-VC be the optimal solution value.

The "LP relaxation" of this BLP is

Let LP-VC be the optimal solution value.

Observation: LP-VC BLP-VC

The dual of LP (a) is given by:

max 2 yeoleet

S.t. $\forall \text{ ueV} \quad 2 \text{ yeol}$ e: uee

ye70

Let LP-M be the optimal solution value. Notice LP-M = LP-VC.

Consider the BLP obtained by forcing ye & 20113 instead of ye > 0:

max 2 ycett

s.t. 4 veV 2 yc ≤ 1e:uee

yc & {0,13.

Let BLP-M be the optimal solution value. Observe:

BLP-M E LP-M

BLP-M = LP-VC = BLP-VC

demma: Mand Care a matching and a cover, then $|M| \leq |C|$ Theorem: If G=(U,F) is a bipartite graph and M^* and C^* are optimal matching and cover. Then $|M^*|=|C^*|$.

Proof: The constraint matrix for LP (3) is B, the unsigned incidence matrix, which is TU. By Theorem TU.

MX = BLP-M = LP-NC = BLP-VC=10x1

Capplication of LP duality and TU)
